Introduction

This guide will teach you how to efficiently use `ranger`.

User interface

The main window consists of three panels by default (it's called
[Miller columns](#) by the way):

- the middle one with the contents of the current directory,
- the left one shows the parent directory, with the current
  directory highlighted,
- the right one serves various previews; I will tell you more
  about it later.

If you're familiar with [vim](#), you should feel right at home with
`ranger's` UI conventions. `ranger` uses the `hjkl` keys for
navigation and borrows many idioms from `vim`. For example: `yy`
(copy line in `vim`) copies a file, `pp` pastes it and `dd` cuts the
file. The more complex functions may be called from the
command line invoked with `:` (a colon).

The current file's attributes may be seen at the bottom and the
current directory path may be seen at the top.

For the `mc` users

If you're familiar with `mc` ([Midnight Commander](#)) the first thing
you may notice is the lack of the second panel for the file
navigation. It may seem like a limitation but in most cases people
use only one panel at a time. `ranger` allows you to create new
tabs (like in a web browser) and switch between them with either
`Alt-number` or `Tab`. If you open just two tabs, `ranger's` tabs
effectively behave just like `mc's` panels. And you can even open
more if such need arises.

Movement

The basic movement keys are inspired by `vim`: `jk` moves up
and down, `l` enters the selected directory or opens a file and `h`
returns to the parent directory. Many other navigation keys known
